

▶ Polycom® KIRK® DECT Encryption

When security matters in your wireless organization

Full security with KIRK Wireless Solutions

To secure your mobile communication, Polycom® KIRK® solutions come with full encryption of subscription and authentication, using the up-to eight-digit access code, which is the maximum encryption supported by the DECT standard.

Polycom KIRK solutions also offer the opportunity for generation of a new key for every call and a security beyond the DECT standard (non-GAP).

In addition, you find below a list of KIRK products that come with encryption of the voice packet and thereby providing you with the highest level of security within the DECT standard.

Please note that the encryption of the voice packets is not supported by the KIRK Repeaters.
